

DELTA POWER

DECREASING

0.79 to 0.45

42% lower across trials

THETA / ALPHA

DECREASING

1.48 to 0.88

41% lower across trials

BUTTON SUCCESS

INCREASING

45% to 95%

Every trial contains scored responses

FACIAL LATENCY

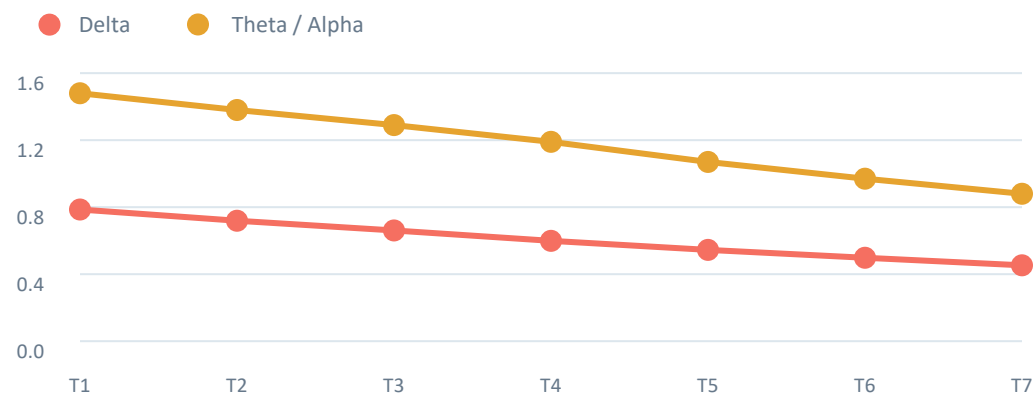

FASTER

3.1s to 1.3s

Prompt-to-response onset

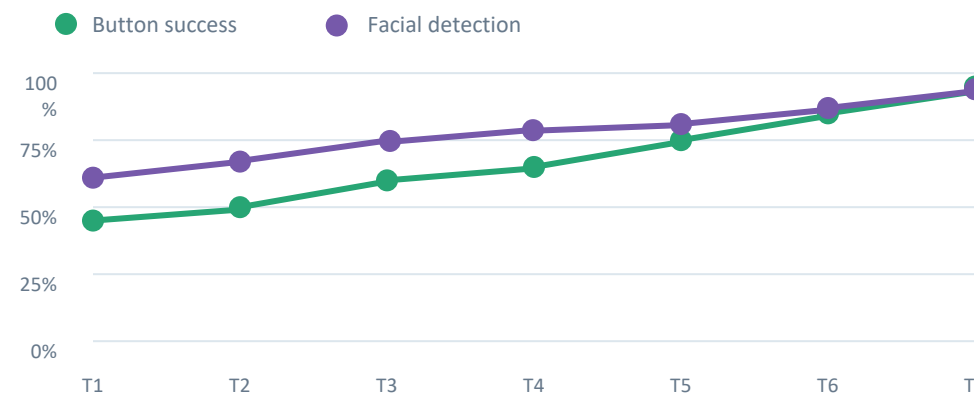

EEG trend

Strictly decreasing synthetic values across matched trials

Observable response

Two independent task-linked response channels

THE STORY IN ONE GLANCE

Across seven matched synthetic trials, Delta power and the Theta-to-Alpha ratio fall steadily, while therapist-labelled button success rises from every populated session. Facial response onset becomes faster and more consistently detected. Together, the four trends demonstrate how CogniThread can turn synchronised EEG, behaviour and facial-response signals into a clear longitudinal narrative.
